In this section the one-zone model of Baker (1966), originally used to study the Cepheïd pulsation mechanism, will be briefly reviewed, see Fig. 2, Table 4 and Eq. (3). For the one-zone-model Baker obtains necessary conditions for dynamical, secular and vibrational (or pulsational) stability (Eqs. (34a, b, c) in Baker 1966).

$$\tau_{\rm co} = \frac{E_{\rm th}}{L_{r0}}\,,\tag{1}$$

and the local free-fall time

$$\tau_{\rm ff} = \sqrt{\frac{3\pi}{32G}} \frac{4\pi r_0^3}{3M_r} \,, \tag{2}$$

Baker's K and σ_0 have the following form:

$$\sigma_0 = \frac{\pi}{\sqrt{8}} \frac{1}{\tau_{\rm ff}} \tag{3}$$

$$K = \frac{\sqrt{32}}{\pi} \frac{1}{\delta} \frac{\tau_{\rm ff}}{\tau_{\rm co}}; \tag{4}$$

where $E_{\rm th} \approx m(P_0/\rho_0)$ has been used and

$$\delta = -\left(\frac{\partial \ln \rho}{\partial \ln T}\right)_{P}$$

$$e = mc^{2}$$
(5)

is a thermodynamical quantity which is of order 1 and equal to 1 for nonreacting mixtures of classical perfect gases. The physical meaning of σ_0 and K is clearly visible in the equations above. σ_0 represents a frequency of the order one per free-fall time. K is proportional to the ratio of the free-fall time and the cooling time. Substituting into Baker's criteria, using thermodynamic identities and definitions of thermodynamic quantities,

$$\Gamma_{1} = \left(\frac{\partial \ln P}{\partial \ln \rho}\right)_{S}, \ \chi_{\rho} = \left(\frac{\partial \ln P}{\partial \ln \rho}\right)_{T}, \ \kappa_{P} = \left(\frac{\partial \ln \kappa}{\partial \ln P}\right)_{T}$$

$$\nabla_{\mathrm{ad}} = \left(\frac{\partial \ln T}{\partial \ln P}\right)_{S} , \ \chi_{T} = \left(\frac{\partial \ln P}{\partial \ln T}\right)_{\rho} , \ \kappa_{T} = \left(\frac{\partial \ln \kappa}{\partial \ln T}\right)_{T}$$

The jump in table numbering below is caused by the command \longtable*. This command only works in the onecolumn environment. For this reason, we recommend either:

- placing your long tables in onecolumn appendices (cf. C.1 and E.1),
- or using the longtab environment as illustrated by tables 2 and 3. Note that the longtab environment will preserve the table numbering and automatically places long tables after the appendices. They will be moved inside the appendices by the Publisher, if necessary.

Appendix A: Wide tables and figures after an appendix title: recommended method

In the PDF output, floats should be placed under their own appendix, not before the title, nor after the title of the next appendix. In short appendices, one-column floats {figure*} or {table*} will generate a blank page. To prevent this behaviour, we recommend to switch to \onecolumn and set the [h!] parameter in your floats: please check the Lagrange of this appendix.

In case you have a lot of floating objects for little text and the LATEXengine moves the floats away from their context, the command \FloatBarrier of the "placeins" package will empty the float buffer and place all stored floats in the continuity. If you still encounter problems with wide floats placement, just use the \onecolumn environment throughout the appendices.

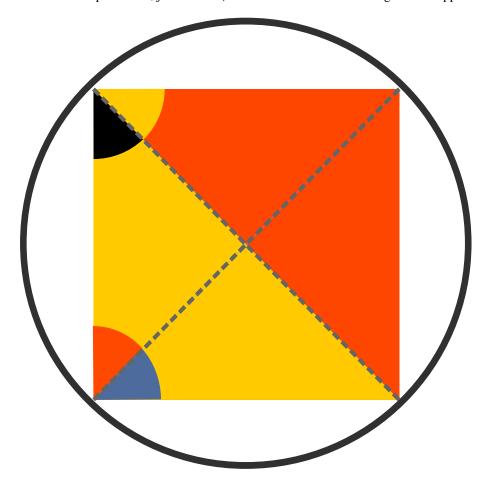

Fig. A.1: A one-column {figure*}[h!] after a section title. If text follows like below, it is easier to finish the section in \onecolumn. If needed, you may revert to \twocolumn when reaching the next page.

Appendix B: Wide tables and figures after an appendix title: alternate method

To prevent a blank page, a second method is to insert the appendix title \underline{after} declaring the onecolumn float. This method should be reserved to appendices containing only one-column floats{figure*} or {table*} and no text.
